Examiner V. Patel Page 2 of 12

IN THE CLAIMS:

Claims 1-20 (cancelled)

21. (previously presented) A coupling comprising:

first and second generally tubular members each having a sealing end face, a raised,

annular sealing bead, an inner bore, and a frictional surface located radially outward of said

sealing bead, said tubular members being generally coaxially arranged such that said sealing

faces face each other; and

a sealing gasket captured between said sealing beads for sealing said coupling, wherein

said frictional surface engages said sealing gasket to prevent relative rotation between said

tubular members; said sealing gasket having two respective sides,

wherein said sealing gasket includes a sealing surface on each of said respective sides of

said gasket, each of said sealing surfaces contacting one of said sealing beads of said tubular

members and an anti-rotation surface on each of said respective sides of said gasket, each of said

anti-rotation surfaces contracting one of said frictional surfaces of said tubular members, wherein

each of said respective sealing surfaces and anti-rotation surfaces are co-planar upon assembly of

the coupling.

22. (previously presented) The coupling of claim 21 wherein said frictional surface has raised

protrusions.

{K-S0385.DOC;1}

Serial No.: 10/604,700

Art Unit: 3679 Examiner V. Patel

Page 3 of 12

23. (previously presented) The coupling of claim 22 wherein said raised protrusions are formed

by knurling.

24. (previously presented) The coupling of claim 23 wherein said knurling extends generally

radially.

25. (cancelled)

26. (previously presented) The coupling of claim 38 wherein each pin extends axially forwardly

a distance slightly greater than its respective bead.

27. (previously presented) The coupling of claim 38 wherein said pins are generally equally

radially spaced.

28. (cancelled)

29. (currently amended) The coupling of claim 28 39 wherein said flange has a taper portion that

reduces in thickness in an axial direction, and therein said groove is correspondingly tapered to

closely receive said flange.

30. (previously presented) The coupling of claim 28 39 further comprising a second groove on

{K-S0385.DOC;1}

Examiner V. Patel

Page 4 of 12

said second tubular member and a second flange on said first tubular member, said second flange

being disposed in said second groove.

31. (previously presented) The coupling of claim 28 39 wherein said groove and said flange are

located radially outward of said gasket.

32. (currently amended) A The gland for use in a coupling assembly, wherein said gland

includes:

a sealing end face, a raised annular sealing bead located on said sealing end face and an

inner bore; and

a frictional surface comprising a radially extending band located radially outward of said

raised annular sealing bead; wherein said sealing bead forms a sealing surface and said frictional

surface forms an anti-rotation surface, and wherein said sealing surface and said anti-friction

surface are generally co-planar upon engagement with a sealing gasket.

33. (previously presented) The gland of claim 32 wherein said frictional surface has raised

protrusions.

34. (previously presented) The gland of claim 33 wherein said raised protrusions are formed by

knurling.

{K-S0385.DOC;1}

Serial No.: 10/604,700

Art Unit: 3679 Examiner V. Patel

Page 5 of 12

35. (previously presented) A coupling comprising:

a first tubular member and a second tubular member, each of said tubular member

including a raised annular sealing bead and a frictional surface located radially outward from

said sealing bead; and

a gasket of generally uniform thickness;

wherein said annular sealing beads contact said gasket to form a sealing surface and said

frictional surface contacts said gasket to form an anti-rotation surface; and wherein said sealing

surface and said anti-rotation surface are generally co-planar upon assembly of the coupling.

36. (previously presented) The coupling of claim 21 wherein said frictional surface is slightly

recessed from said sealing beads.

37. (previously presented) The coupling of claim 21 wherein said frictional surface is coplanar

with said sealing beads.

38. (previously presented) A coupling comprising:

first and second generally tubular members each having a sealing end face, a raised,

annular sealing bead, an inner bore, and a frictional surface located radially outward of said

sealing bead, said tubular members being generally coaxially arranged such that said sealing

faces face each other; and

a sealing gasket captured between said sealing beads for sealing said coupling, wherein

{K-S0385.DOC;1}

Serial No.: 10/604,700

Art Unit: 3679 Examiner V. Patel

Page 6 of 12

said frictional surface engages said sealing gasket to prevent relative rotation between said

tubular members;

wherein said sealing gasket includes a sealing surface that contacts said sealing beads of

said tubular members and an anti-rotation surface that contacts said frictional surface of said

tubular members, wherein said frictional surface comprises a plurality of axially-extending pins.

39. (previously presented) A coupling comprising:

first and second generally tubular members each having a sealing end face, a raised,

annular sealing bead, an inner bore, and a frictional surface located radially outward of said

sealing bead, said tubular members being generally coaxially arranged such that said sealing

faces face each other; and

a sealing gasket captured between said sealing beads for sealing said coupling, wherein

said frictional surface engage said sealing gasket to prevent relative rotation between said tubular

members;

wherein said sealing gasket includes a sealing surface that contacts said sealing beads of

said tubular members and an anti-rotation surface that contacts said frictional surface of said

tubular members, wherein said first tubular member includes a generally radially-extending

flange received in a groove on said second tubular member, wherein said flange extends

forwardly from said sealing face of said first tubular member.

40. (previously presented) A coupling comprising:

{K-S0385.DOC;1}

Examiner V. Patel Page 7 of 12

first and second generally tubular members each having:

a sealing end face, a raised annular sealing bead located on said sealing end face

and an inner bore; and

a frictional surface located radially outward of said raised annular sealing bead;

wherein said sealing bead forms a sealing surface and said frictional surface forms an anti-

rotation surface, and wherein said sealing surface and said anti-friction surface are generally co-

planar; and

a sealing gasket captured between said sealing beads for sealing said coupling.

41. (New) A method of coupling two generally tubular members such that relative rotation

between the two generally tubular members is prevented, comprising:

a) retaining a metal sealing gasket in a central opening of a metal locking ring having

two side faces, wherein each side face is inclined with respect to a radial plane and oppositely

inclined such that the width of said ring decreases in the radially outward direction and includes

a knurled surface;

b) clamping the two generally tubular members against the metal seal locking ring and

the metal sealing gasket such that the metal locking ring side faces frictionally engage the tubular

members to thereby prevent relative axial rotation between said tubular members and such that

the metal sealing gasket engages the tubular members to thereby provide a seal between said

tubular members.

42. (New) A method of coupling two generally tubular metal members comprising:

a) assembling a metal sealing gasket with a locking ring having side faces that are

inclined with respect to a radial plane and include a frictional surface;

b) forcing the two generally tubular members into engagement with metal sealing gasket

and the locking ring such that the side faces frictionally engage said tubular members to prevent

relative rotation between the tubular members and such that a the metal sealing ring engages a

sealing bead of each tubular member to provide a seal between the tubular metal members.

43. (New) A method of coupling a metal sealing gasket and a metal locking ring, comprising:

retaining the metal sealing gasket in a central opening of the metal locking ring having two side

faces, wherein each side face is inclined with respect to a radial plane and oppositely inclined

such that the width of said ring decreases in the radially outward direction and includes a knurled

surface.
